

FLASHRITE

FLEXIBLE CORNER SHINGLE

No Holes, No Leaks, No Call Backs

FlashRite is a one-piece flexible corner shingle designed specifically for the corners of base flashings. Designed for use in conjunction with standard base flashing materials, FlashRite can be used right hand, left hand, head or sill flashing, and can form to any roof pitch. It is convenient to use around any wall corners including chimneys, dormers, or two story walls. FlashRite can also be used where ridge caps meet a wall.

No Holes:

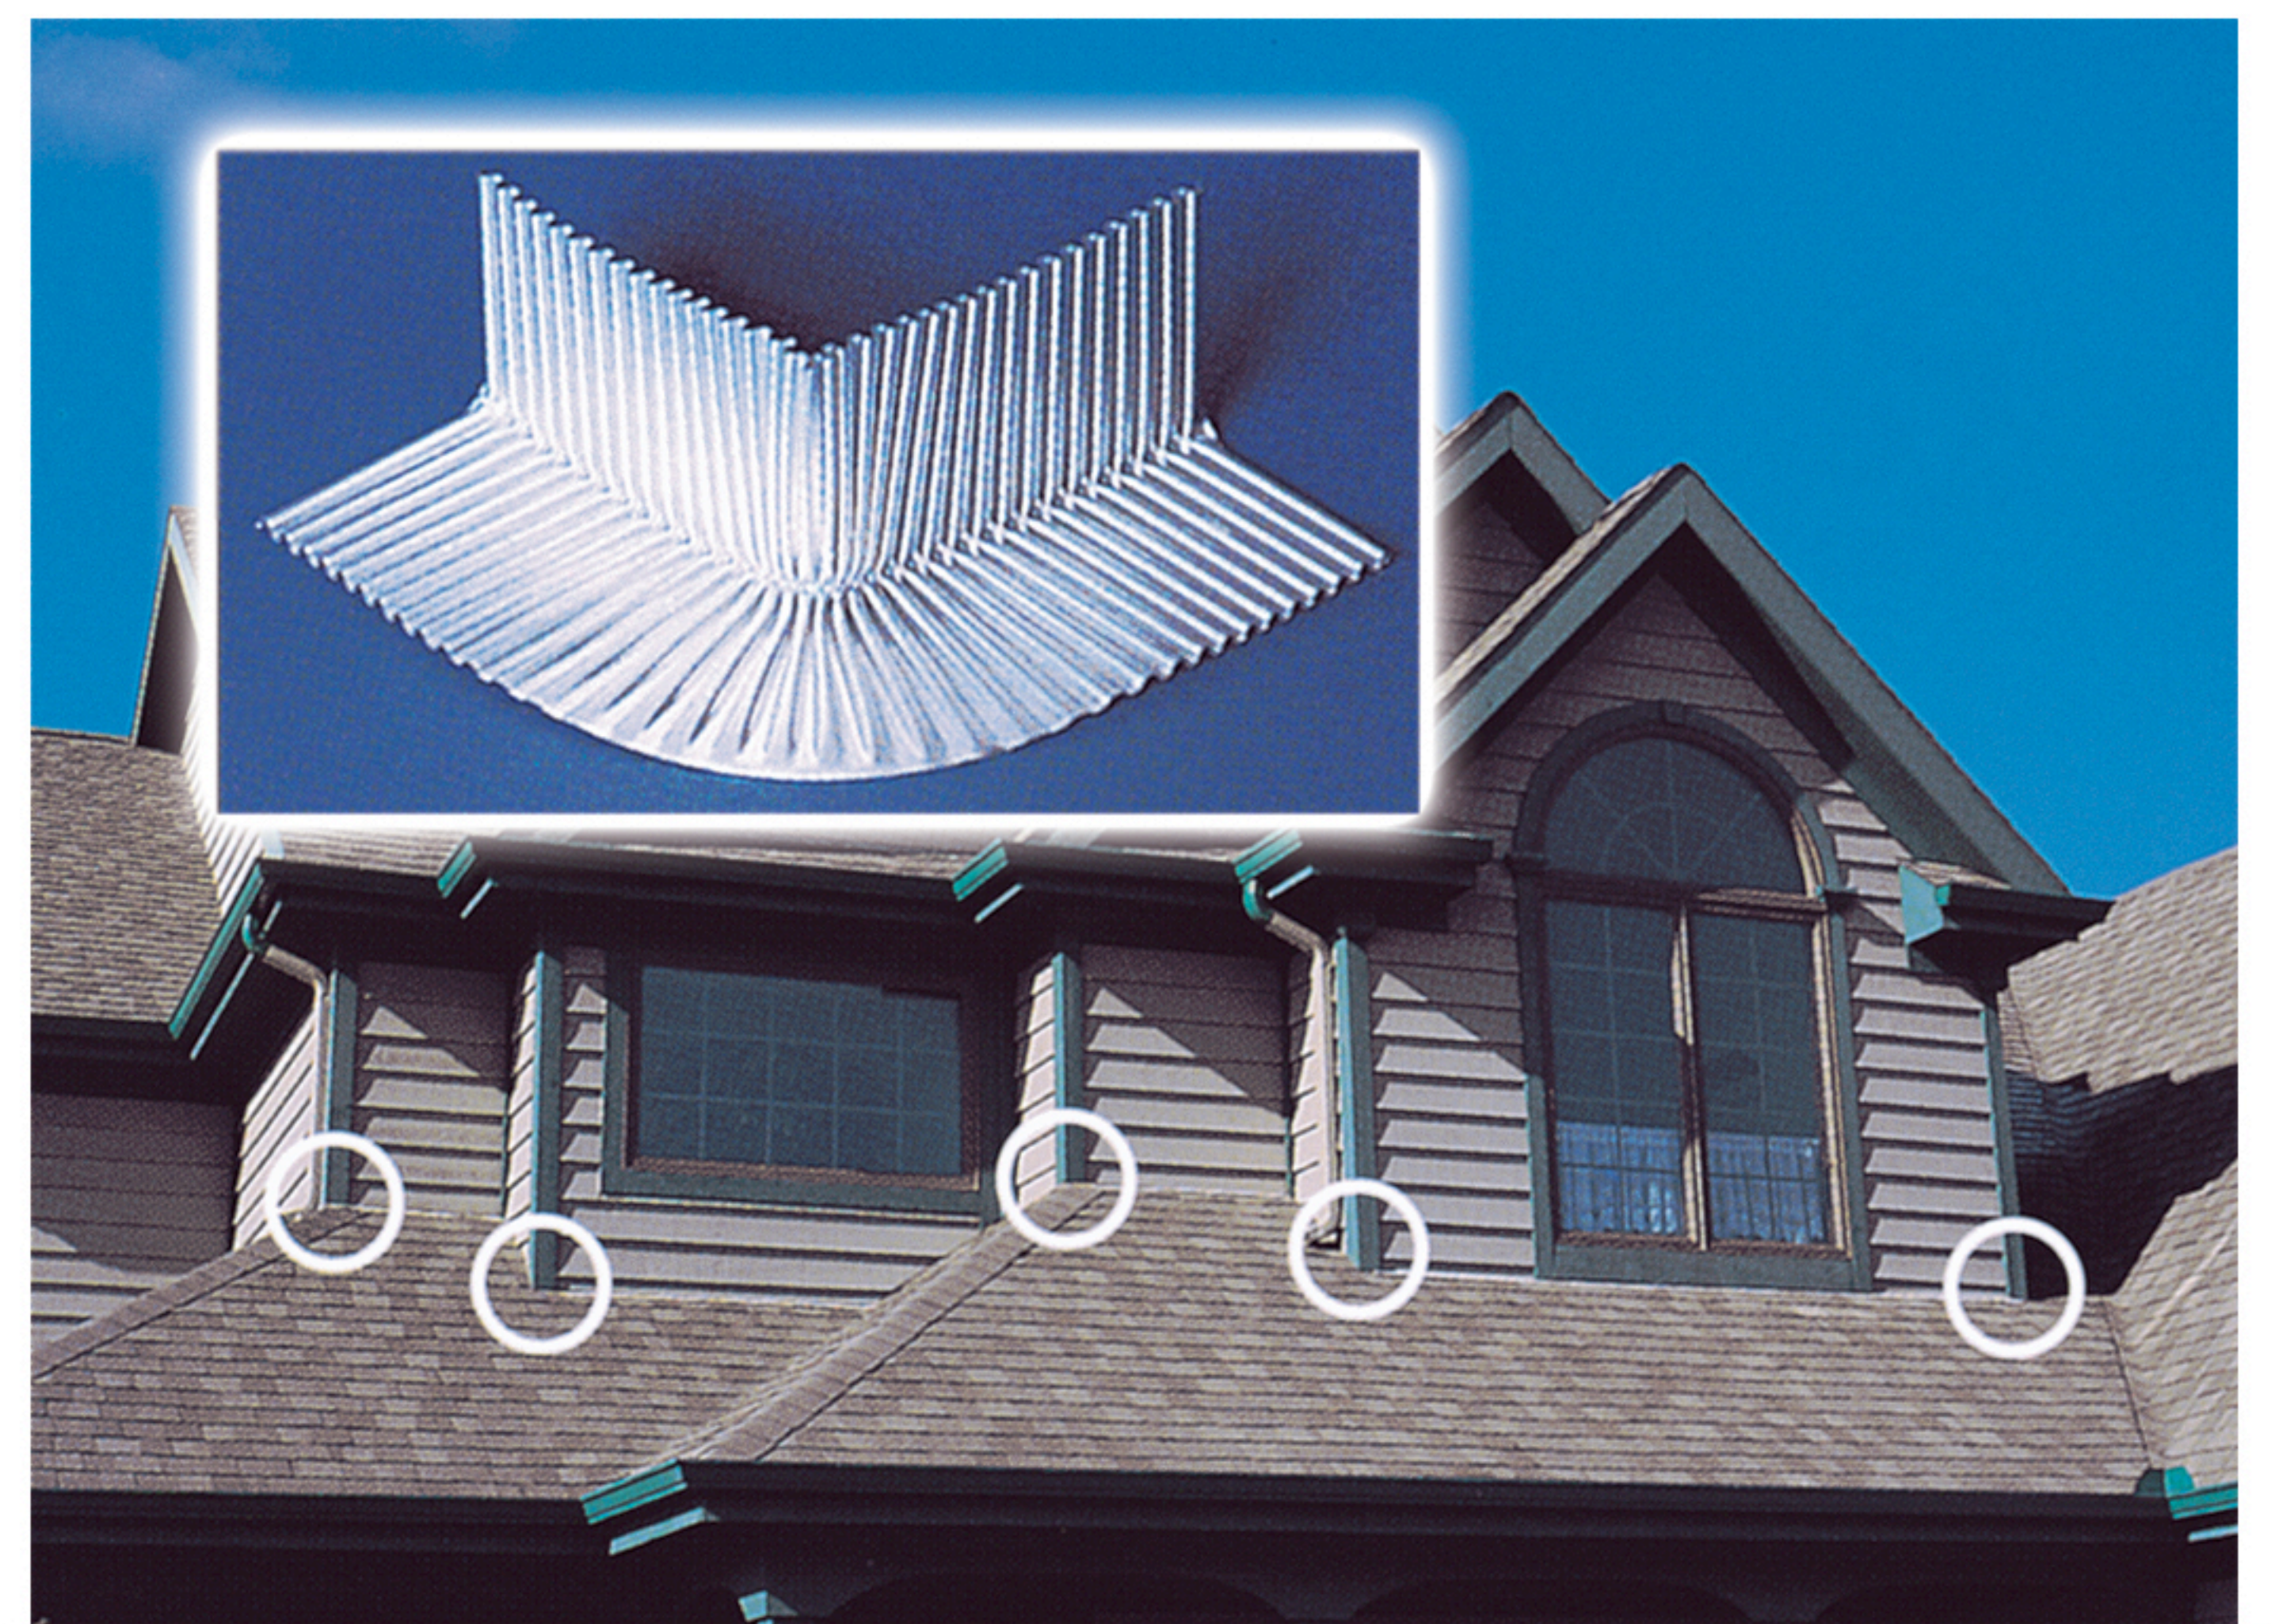

FlashRite Corner Shingles are a huge time saver on any job! The one-piece design eliminates the hole in the critical corner of the base flashing. This saves the contractor the time and trouble involved in fabricating a corner from sheet goods.

No Leaks:

By eliminating holes in the base flashing corners, FlashRite also removes the need to rely on roof cement to seal the corner. The result is a superior flashing job that will last the lifetime of the roof.

No Call Backs:

No holes and no leaks mean no callbacks. With satisfied customers, contractors save valuable time and money. Flashrite improves the quality of work and creates a better reputation for contractors. An excellent reputation is priceless!
